## **StatCom “Turns 40”**

### ***Forty hospitals to implement StatCom’s leading patient flow software to improve efficiency, communication and care***

November 1, 2004 (Atlanta) — Today StatCom celebrated “turning 40,” announcing that 40 hospitals across 22 healthcare organizations will be implementing its Web-based patient flow software.

“StatCom’s fast growth is a testament not only to healthcare’s need for a patient flow solution, but also to StatCom’s viability. With leading new technology such as the WIBUT, StatCom clients are ‘going wireless,’ instantly communicating across the hospital, and making great strides to improve efficiency and care,” stated Richard L. Jackson, CEO and President of StatCom.

StatCom clients include prestigious healthcare organizations such as Bassett Healthcare, serving eight counties in upstate New York; Ochsner Clinic Foundation in New Orleans; and Alegant Health, serving Iowa and Nebraska.

A Web-based software application, StatCom creates a common infrastructure across the healthcare system for instant communication, patient and resource tracking, and automated workflow. StatCom is an unobtrusive, enterprise catalyst for improved patient flow: It is mapped to existing processes and uses current information systems along with intuitive, customized Web displays and input devices. Through its rules-based workflow engine, it automatically communicates within and across departments to trigger the next action in the continuum of care - reducing wasted time, automating communication and “handoffs,” and decreasing confusion and task redundancy.
